

- 405 Progress Toward Achieving the 1990 Objectives for Pregnancy and Infant Health
- 413 Human Cutaneous Anthrax – North Carolina, 1987

MORBIDITY AND MORTALITY WEEKLY REPORT

Perspectives in Disease Prevention and Health Promotion**Progress Toward Achieving the 1990 Objectives for Pregnancy and Infant Health**

The 1990 Health Objectives for the Nation, published by the Public Health Service (PHS) in 1979, included 19 objectives related to pregnancy and infant health (1). PHS identified 13 of these as "priority objectives" for federal programs and activities (Table 1). These objectives concern improving the health status, reducing risk factors, increasing public and professional awareness, and improving health services and protection for mothers and infants. The Office of Maternal and Child Health (OMCH), Bureau of Maternal and Child Health and Resources Development, Health Resources and Services Administration (HRSA), is responsible for monitoring federal efforts to reach these objectives. Progress is assessed by monitoring national vital statistics and, when national data sets are not available, by selected studies.

Despite numerous public and private efforts, current projections for 1990 indicate that the majority of objectives for improving health status and reducing risk factors for pregnant women and infants will not be met (Table 2). The decline in the infant mortality rate (IMR) has slowed since the preceding decade, and no progress has been made in reducing low birthweight (LBW)—less than 2,500 grams (2,3). Between 1970 and 1981, the IMR in the United States declined by nearly 5% per year. Between 1981 and 1985, the decline slowed to less than 3% per year. Based on estimates of the National Center for Health Statistics (NCHS), recent rates now exceed the confidence limits estimated from the 1970–1981 trend. The 1970–1981 trend projected the 1990 IMR to be 7.8 per 1,000 live births. The 1981–1985 trend projects a 1990 IMR of 9.1 per 1,000 live births. In addition, the 1970–1981 trend analysis projected that 41 states would meet the 1990 objective of no more than nine deaths per 1,000 live births. The 1981–1985 analysis projects that 25 states will meet this objective.

Between 1970 and 1985, IMR has decreased by 50% and LBW rate by 15%. Thus, most of the progress in reducing infant mortality over the past 15 years has resulted from a decline in birthweight-specific mortality; that decline, in turn, is likely due to technologic improvements in perinatal care. The LBW rate (6.8%) was the same in 1980 and 1985. The incidence of very LBW infants (less than 1,500 grams at birth) has been increasing in recent years. The 1990 LBW projection of 6.7% is 35% higher than the objective.

1990 Objectives — Continued

Programs to promote the use of infant safety seats in automobiles have been successful. The objective for such use has been met, according to survey data. In June 1987, in a sample study involving 19 cities, more than 75% of toddlers and infants were observed to be in safety seats (4).

National data are available for only part of the objective related to increased public and professional awareness of nutritional needs and of the hazards caused by smoking and by using alcohol and drugs during pregnancy. National survey results indicate that pregnant women and women who have recently been pregnant are more knowledgeable about smoking and alcohol risks than are members of the general population 18 to 44 years of age (5).

Progress has been made in one of the four priority objectives for improving services and protection: all states have screening programs for newborns (6). Progress has been limited or cannot be assessed for the other three objectives in this category. In 1980, 73.3% of pregnant women received first-trimester prenatal care, and in 1985, 76.2% received such care. Recent studies confirm that access to care remains inadequate for many women (7). No data are available for assessing the

TABLE 1. 1990 Federal priority objectives for pregnancy and infant health

Improved Health Status

1. National infant mortality rate (IMR) should be reduced to no more than 9 deaths per 1,000 live births.
2. The neonatal death rate should be reduced to no more than 6.5 deaths per 1,000.
3. The perinatal death rate should be reduced to no more than 5.5 deaths per 1,000.
4. No county, racial, or ethnic group should have an IMR in excess of 12 deaths per 1,000.
5. No county, racial, or ethnic group should have a maternal mortality rate of more than 5 deaths per 100,000 live births.

Reduced Risk Factors

6. Low birthweight (LBW) babies (less than 2,500 grams) should constitute not more than 5% of live births.
7. No county, racial, or ethnic group should have an LBW rate that exceeds 9%.
8. The majority of infants should leave hospitals in car safety seats.

Increased Public Awareness

9. Eighty-five percent of women of childbearing age should be able to choose foods wisely and should understand the hazards of smoking, alcohol, and drugs during pregnancy and lactation.

Improved Services and Protection

10. All women and infants should be served at a level appropriate to their need by a regionalized system of perinatal care.
 11. The proportion of women in any county, racial, or ethnic group who obtain no prenatal care during the first trimester of pregnancy should not exceed 10%.
 12. All newborns should be screened for metabolic disorders for which effective tests and treatments are available.
 13. All infants should be able to participate in comprehensive primary health care.
-

1990 Objectives – Continued

progress being made in providing regionalized systems of perinatal care or for estimating the availability of primary care services for infants.

Reported by: Office of Maternal and Child Health, Bureau of Maternal and Child Health and Resources Development, Health Resources and Services Administration. Office of Disease Prevention and Health Promotion. National Institute of Child Health and Human Development, National Institutes of Health. National Center for Health Statistics; Div of Reproductive Health, Center for Health Promotion and Education, CDC.

Editorial Note: Efforts to achieve the objectives for pregnancy and infant health must be sustained and strengthened. The Low Birthweight Prevention Work Group, formed in 1984 with representation of experts on maternal and infant health from organizations within the Department of Health and Human Services, has served as the focus and coordinating body within the federal government for service, research, and information efforts to address LBW and other causes of infant mortality in the United States. This group has worked to develop a broad national strategy to understand and effect improvements in LBW and IMR. Highlights of recent initiatives follow.

Efforts to improve coordination and effectiveness of health services have intensified. The National Governors' Association and HRSA are collaborating to assist states in implementing the current expanded Medicaid eligibility and coverage options. In a related activity, the Health Care Financing Administration and OMCH are working with the Medicaid/Maternal and Child Health Technical Advisory Group in promoting best practices for Medicaid and Title V programs at the state level. In a private/public partnership, the Robert Wood Johnson Foundation and OMCH are collaborating on grant initiatives in states with high infant mortality to support improved health care for pregnant women and their infants.

The prevention of LBW has been identified by the National Institute of Child Health and Human Development as a major research initiative. Research is focusing on mechanisms involved in premature labor and intrauterine growth retardation,

TABLE 2. 1985 Rates, 1990 projected rates, and 1990 target rates, by race, for the 1990 objectives for pregnancy and infant health*

Rate	1985 Rates			1990 Projected Rates [†] (and 1990 Target Rates)		
	All Races	White	Black	All Races	White	Black
Infant mortality (IMR)	10.6	9.3	18.2	9.1 (9.0)	7.9	15.9 (12.0)
Neonatal mortality	7.0	6.1	12.1	5.7 (6.5)	4.9	10.1 (8.7) [‡]
Postneonatal mortality	3.7	3.2	6.1	3.5 (2.5) [‡]	3.0	5.9 (3.3) [‡]
Perinatal mortality	10.7	9.6	17.4	8.5 (5.5)	7.7	14.7 (7.3) [‡]
Maternal mortality	7.8	5.2	20.4	7.0 (5.0)	4.1	20.5 (5.0)
Low birthweight (LBW)	6.8	5.6	12.4	6.7 (5.0)	5.6	12.3 (9.0)
Prenatal care delay	23.8	20.6	38.2	23.6 (10.0)	20.4	38.5 (10.0)

*Maternal mortality rate per 100,000 live births, prenatal care delay rate and LBW rate per 100; all other rates per 1,000 live births.

[†]Projections based on log-linear regressions of 1981–1985 rates.

[‡]Implied target based on distribution of targets for age-at-death within IMR for all races.

[§]Implied target based on 1990 targeted racial differential for IMR.

1990 Objectives - Continued

evaluation of methods for preventing and treating disorders affecting LBW, and racial and ethnic differences in mortality and LBW.

A national system that links infant death and birth records is essential to the effective monitoring of trends and identification of high-risk populations. Therefore, a system for matching birth and death certificates has been implemented by NCHS. Also, a survey will be conducted by NCHS to collect data on births, fetal and infant deaths, national population estimates of maternal smoking and drinking, and access to prenatal care. Surveys on the nutritional status and on behaviors of mothers are being planned by some states in collaboration with CDC.

(Continued on page 413)

TABLE I. Summary - cases of specified notifiable diseases, United States

Disease	26th Week Ending			Cumulative, 26th Week Ending		
	Jul. 2, 1988	Jul. 4, 1987	Median 1983-1987	Jul. 2, 1988	Jul. 4, 1987	Median 1983-1987

*Mortality data in this table are voluntarily reported from 121 cities in the United States, most of which have populations of 100,000 or more. A death is reported by the place of its occurrence and by the week that the death certificate was filed. Fetal deaths are not included.

**Pneumonia and influenza.

†Because of changes in reporting methods in these 3 Pennsylvania cities, these numbers are partial counts for the current week. Complete counts will be available in 4 to 6 weeks.

††Total includes unknown ages.

‡Data not available. Figures are estimates based on average of past available 4 weeks.

*Epidemiologic Notes and Reports***Human Cutaneous Anthrax – North Carolina, 1987**

On July 10, 1987, a 42-year-old male maintenance worker at a North Carolina textile mill noticed a small, red, pruritic, papular lesion on his right forearm. Over the next week, the lesion became vesiculated and then developed a depressed black eschar with surrounding edema. On July 18, 24 hours after beginning treatment with an oral cephalosporin and a topical antifungal agent, he was hospitalized with worsening edema, pain, fever, and chills. Cutaneous anthrax was diagnosed. After the patient was treated with intravenous ampicillin and cephalosporins, his condition improved, and he was discharged on a regimen of oral cephalosporin. Cultures of blood and wound tissue were negative. An electrophoretic immunotransblot assay for antibody to anthrax antigens demonstrated a titer of 512 to anthrax protective antigen and lethal factor (1). The patient's lesion healed with residual local scarring, and he returned to work in late August 1987.

The patient had not traveled recently outside of North Carolina, been exposed to domestic or wild animals, worked with objects made of animal materials other than those at the mill, or used bone meal fertilizer. The textile mill has been in operation for 25 years and employs about 210 workers. No known cases of anthrax have occurred among the workers before, and there has never been a vaccination program. The mill produces yarn from domestic wool and wool imported from Australia and New Zealand; cashmere goat hair from China, Afghanistan, and Iran; and camel hair from China and Mongolia.

To assess the degree of *Bacillus anthracis* contamination in the mill, investigators collected samples of raw and processed materials and environmental debris from the plant. *B. anthracis* was grown from 8 (14%) of the 59 samples tested. Five samples of West Asian cashmere were positive for *B. anthracis*, as was one sample of Australian wool and two samples of surface debris from the storage area. It was not possible to

Anthrax – Continued

determine whether the cashmere came from Iran or Afghanistan. Upon its arrival in the United States, all cashmere used in the mill is first washed in a plant in Texas and then shipped in bales to North Carolina. Although no cases of anthrax were diagnosed in Texas, eight of 12 cashmere samples (and none of four camel hair samples) obtained at the Texas plant were positive for *B. anthracis*. A vaccination program for exposed workers at both sites has been recommended (2).

Reported by: PM Briggs, RN, BG Delta, MD, SR Keener, MD, Mecklenburg County Health Dept; JI Freeman, DVM, JL Hunter, DVM, JN MacCormack, MD, MPH, State Epidemiologist, North Carolina Dept of Human Resources. JW Ezzell, PhD, Bacteriology Div, US Army Medical Research Institute of Infectious Diseases, Fort Detrick, Maryland. Bacterial Zoonoses Activity and Meningitis and Special Pathogens Br, Div of Bacterial Diseases, Center for Infectious Diseases; Div of Field Svcs, Epidemiology Program Office; National Institute for Occupational Safety and Health, CDC.

Editorial Note: This is the first case of human anthrax to occur in the United States since 1984. Only nine cases have occurred in this country in the past decade. The practice of vaccinating workers involved in the industrial processing of imported animal products and the decline in using fibers of animal origin are the primary factors in the current low incidence of human anthrax in this country (3). Despite the rarity of anthrax, it should be considered in the differential diagnosis of suggestive skin lesions, especially for high-risk persons, such as workers who process materials of animal origin from areas of the world where the disease is endemic and veterinarians and agricultural workers who handle infected animals.

Cutaneous anthrax was diagnosed on the basis of the characteristic skin lesion and the positive immunologic assay. The cultures were probably negative because the patient had been treated with a broad-spectrum antibiotic before sampling. The most likely source of his infection was the textile mill, since he had no other history of exposure and the mill was found to be contaminated with *B. anthracis*. Maintenance workers in textile mills are at high risk because their duties take them throughout the mill on a regular basis and the nature of their work makes them prone to minor skin injuries that can become contaminated by the bacteria.

The West Asian cashmere was probably the contaminant at the mill. Western Asia is an endemic area for anthrax, and five of the eight positive samples from the mill were from this material. In addition, all of the positive samples from the Texas plant were from cashmere, but none of the camel-hair specimens were positive. The positive sample of Australian wool may have been cross-contaminated because it was stored in the same room as the positive cashmere samples.

This case demonstrates that the potential for occupational transmission of *B. anthracis* still exists and that careful attention must be given to preventive measures. Such measures include vaccinating potentially exposed workers and educating workers about how anthrax is transmitted.

The *Morbidity and Mortality Weekly Report* is prepared by the Centers for Disease Control, Atlanta, Georgia, and available on a paid subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, (202) 783-3238.

The data in this report are provisional, based on weekly reports to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday. The editor welcomes accounts of interesting cases, outbreaks, environmental hazards, or other public health problems of current interest to health officials. Such reports and any other matters pertaining to editorial or other textual considerations should be addressed to: Editor, *Morbidity and Mortality Weekly Report*, Centers for Disease Control, Atlanta, Georgia 30333.
